Grp./A.U.: 2645

Examiner: Gerald Gauthier

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

AFFIDAVIT UNDER 37 C.F.R. §1.131

I, Chin-Hui Lee, hereby state:

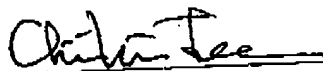

1. I am an inventor of the claimed subject matter in the Patent Application identified above and an inventor of the subject matter described therein..
2. Prior to April 16, 1999, my co-inventor and I participated in the conception of spotting key segments in voice messages, as covered by the above-identified Patent Application, as evidenced by the following:

We submitted notations for a patent application disclosing my conception of the invention prior to April 16, 1999, and after the date of conception. These notations are reflected in an invention submission form, which is kept in the regular course of business. A true and correct copy of this invention submission form is attached hereto as Exhibit A/ Thereafter, we

participated in the preparing information necessary for subsequent filing of the above referenced Patent Application in the United States, which was diligently prepared and filed with the United States Patent Office on June 3, 1999, as evidenced by Exhibits B-G.)

For example, the invention submission form was sent to outside council on June 16, 1998, to prepare a patent application as evidenced by Exhibit B. We reviewed drafts of the patent application and provided comments and changes to the various drafts until a final draft was completed. Evidence of the draft applications that we reviewed is provided by Exhibits C, D, E and F. The first draft was sent to my co-inventor on October 15, 1998, for our review as evidenced by Exhibit C. Additionally, the second draft was sent November 3, 1998, as evidenced by Exhibits D, the third draft was sent February 10, 1999, as evidenced by Exhibit E and the final draft was sent May 12, 1999, as evidenced by Exhibit F. After the final draft was completed and ready for filing, we signed the Declaration and Assignment forms as evidenced by Exhibit G.

I declare further that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the Application or any patent issuing thereon.

Voice Message Filtering for Classification of Voice Messages according to the Caller

Padma Ramesh and Chin-Hui Lee

This is an application of Speaker Verification and Speaker ID for identifying the callers and classifying the messages in Voice mail.

For example, To get messages from the caller "Tom": Use speaker verification and/or identification to Detect the messages from "Tom".

This application also uses the current knowledge in speech recognition, wordspotting, utterance verification, and extends it to the voice message filtering application to classify and retrieve messages from the callers. It will also use speech coding technology for use with coded voice mail messages. There is no known product at this time for this application.

The purpose of this application is to identify the caller and classify the voice messages according to the caller. The call classes can be assigned priorities based on the caller. This enables priority messaging, which is important when sorting through a lot of voice mail messages. This speeds up the process of looking for messages from certain people. This invention will verify if the message is from a registered or a given caller and then classify the messages according to the caller. It can then retrieve only the desired messages. This will enable one to just get to the desired message instead of having to listen to all the messages sequentially up to the one, the user is interested in.

Caller classification and message filtering is achieved by the following steps.

1. First the users register the callers they would like to spot in the messages. During the registration, the caller characteristics are stored. Then the user can provide a call priority for the caller class.
2. When a message is received, its caller class is determined by performing speaker verification and/or identification using the caller characteristics. Messages are then sorted using the caller classes.
3. When the user requests messages from the caller class, the messages from that caller class are retrieved from the sorted messages. The user can also request messages with a given call priority. Messages from all the call classes with the given priority are then retrieved.

User Registration:

The following steps are used in the user registration process and is shown in Figs.

- 2 -

1a and 1b.

1. User listens to a message from the caller.
2. The user registers it as a caller class by pressing **S (for save).
3. The caller's characteristics are then saved and stored as a code book or an acoustic segment model with HMM.
4. The system prompts the user to provide a caller class ID.
5. A caller class ID is given to the system as a speech sample from the user, or as text from a keyboard if available, or as a number on the keypad such as #5. Each class can have speech, text, or number ID or any combination of these.
6. The caller class ID is then registered by pressing **R.
7. If speech sample is given for the caller class ID, its pronunciation is obtained by speaker independent speech recognition, and is stored. For the caller class ID of text, a text-to-speech front end is used to determine the pronunciation. The pronunciation is also stored in addition to the text. This can be used later on for message retrieval with speech input.
8. If desired, a call priority can be assigned to the call class by pressing #3**I for a priority of 3. Message classes that are not given any priority by the user are assigned a default priority.
9. The user terminates the registration of this caller by pressing ##.

Message Handling:

Message Handling is shown in Fig. 2a. Every message that is received is compared to the registered caller's voice characteristics. Speaker ID is performed using all the registered voice patterns, or speaker verification can be performed sequentially to identify the caller of the message. The message is then tagged with the caller class ID, as belonging to that caller class. The messages are then classified by the caller classes. Messages that do not belong to any caller class are identified and grouped as belonging to the "other class".

Message Retrieval:

The message retrieval phase is shown in Fig. 3.

1. The user requests messages from a particular caller class by either speaking or typing the caller class ID, or by pressing the keypad number, for example, #5**M for messages from the caller class 5.
2. If the caller class ID is given as speech, speech recognition is performed on all the registered class ID's with pronunciation, to determine the requested class ID.

- 3 -

3. Messages from the requested caller class are played back to the user sequentially.
4. If messages with a particular priority are requested by pressing #3**C for calls with priority of 3, all the messages from call classes with the priority of 3 are played back sequentially.

In addition to caller classification and message retrieval, a list of all the registered callers is provided by **L key. In order to provide a secure access to the messages, speaker verification can be used to verify that the user is an authorized user.

If a caller's voice pattern is not registered, but only their name is registered, the name segment can be detected and verified using Key segment detection and utterance verification using the pronunciation. For example, to get messages from the caller "Tom", detect and verify the phrase "My name is Tom" or "This is Tom" in the message. This is done by using key segment detection and utterance verification, with the speaker independent subword Hidden Markov Models (HMM) and the pronunciation to look for caller name phrases such as "This is Tom", "Tom here", "My name is Tom" and so on. Message Handling when the caller's voice is not registered is shown in Fig. 2b.

Caller classification can also be achieved by registering the phone number for the caller, and extracting the extracting the telephone number using Caller ID (if available).

Key Segment Spotting in Voice Messages

Padma Ramesh and Chin-Hui Lee

This is an application of key phrase detection and verification for key segment spotting in voice mail.

For example, To spot name segments: Detect and verify the segment "My name is ..." or "This is ...". To spot the phone number segment, detect and verify the segment "My number is ..." or "Call me back at" or even spotting the digit part of the message such as "my number is 364-7589".

This application uses the current knowledge in speech recognition, wordspotting, utterance verification, and speech coding, and extends it to the key segment spotting application for voice mail messages. There is no known product at this time for this application.

The purpose of this application is to identify and spot segments containing key information in voice messages. This is important when sorting through a lot of voice mail messages. This speeds up the process of looking for particular messages, messages from certain people, or when looking for certain segments of the messages. This invention will spot the key segments and can then retrieve only the desired segments. This will enable one to just get to the desired section of the message instead of having to listen to the message up to the desired segment.

Keyword Segment Spotting is achieved as follows. First the users register the key segments they would like to spot in the messages. This can be done via text, or by voice. General key segments such as name segments and phone numbers may be provided without registration as predefined segments. To access these the user may use certain keys on the phone, such as, **T for the telephone number segment, **N for the name segment, **D for the date segment, and so on. Furthermore, the telephone number detection with **T allows for phone number verification, as well as for redial with **C. Also, the user may register the key segments by using part of the message itself with **S. This feature will be useful for example, for saving the actual names of the message sender, in order to spot them later.

User registration process is described in Fig. 1. The user inputs the key segment to be registered as either text, pronunciation (text), or speech form. The text is processed through the text-to-speech front end to obtain the pronunciation. Speech is processed through the speech recognizer and a pronunciation is

- 2 -

obtained. This pronunciation is stored as the Key segment characteristics.

When the voice messages are received, these are processed through the message handler shown in Fig. 2. to look for the registered and the predefined key segments. The segment characteristics and speaker independent models (for the sound units of the pronunciation) are used during the message handling, to spot the key segment using wordspotting or phrase detection technology. In addition, utterance verification may be used to enhance the detection accuracy. The messages are then tagged with the key segments and their locations in the messages to facilitate their retrieval later.

The message retrieval phase is shown in Fig. 3. On receiving the user enquiry for a segment, first it is checked to see if it is a registered or predefined segment. If so, the message is already tagged and the desired segment is retrieved. If it is a new key segment, its pronunciation is first obtained as shown in Fig. 1 of user registration, and then the message is tagged using the message handler. After the message is tagged, the desired segment is retrieved.

When a key segment is retrieved, it can be saved for future use as a key segment by the use of the keys **S. This will enable us to save for example, the message sender's name in their own voice for later use of identifying, tagging and retrieving their messages. Furthermore, if the name segment is retrieved, it can be used to identify the caller and hence for message filtering and classification of messages according to the caller.

This application uses speech recognition, wordspotting, keyword detection and utterance verification technologies for spotting the key segments in the messages. It will also use speech coding technology for key segment spotting in coded voice mail messages. It requires utterance verification of variable number digits for retrieving telephone numbers.

Patent Idea 1

Messaging Filtering: "Caller Classification" (using acoustic segment models)

e.g. "Is there any message from _____?"

Two steps: (1) Registration:

(Three functions) e.g. *S for saving the voice char of the specified sender

Also provide user speaker verification

(use VQ or ASM) and attach an ID such as "Arav"

for security

(2) Retrieval and Caller Classification

access enhancement

(3) List all callers being identified: "Arav", "Babbar", "Nikhil", etc.

II "Key Segment Spotting" (using Keyphrase detection & verification)

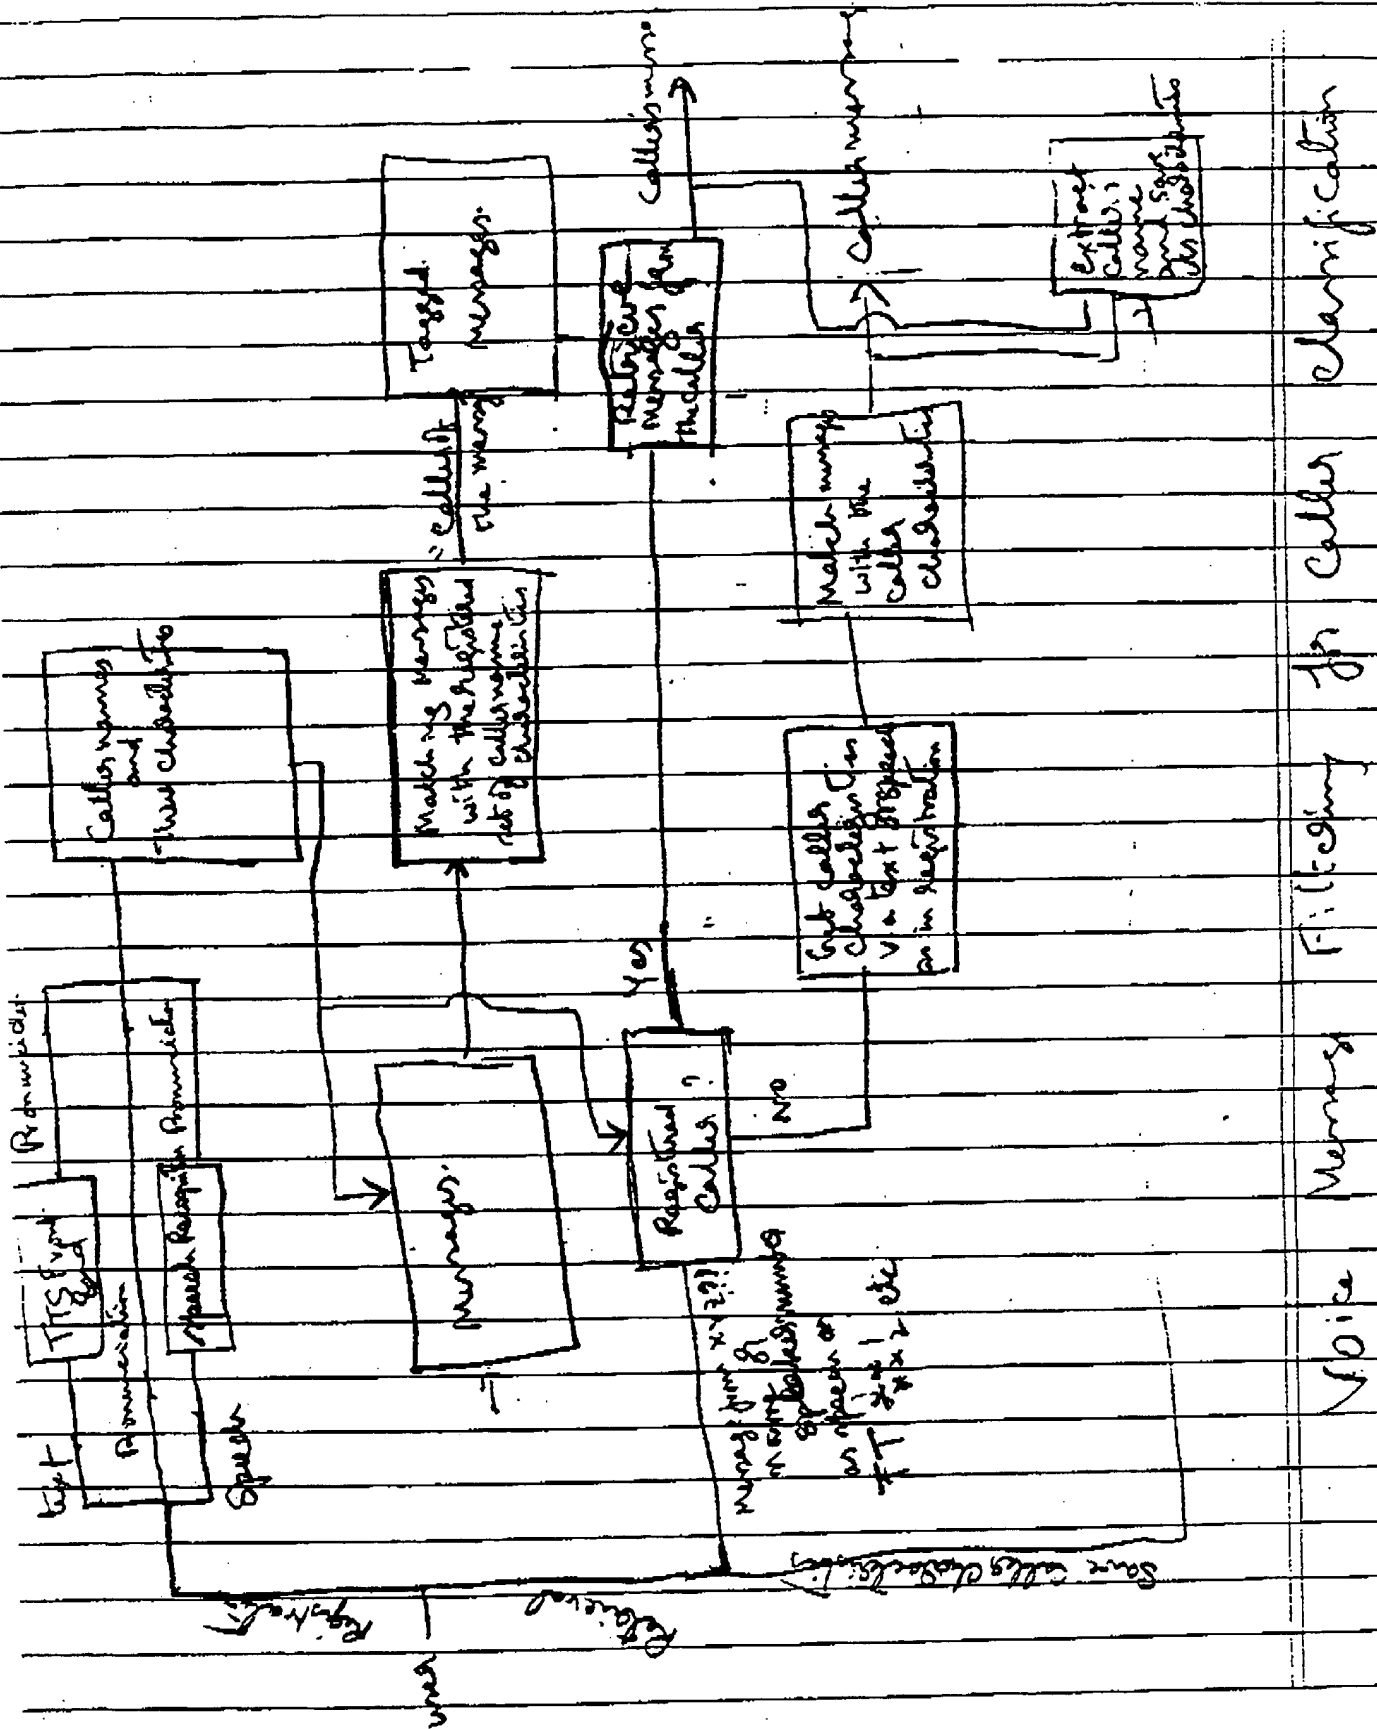

e.g. Name: "My name is ..."
Number: "My number is ..."

purpose: "identify and spotting key segments containing key information based on spotting key phrases from voice messages" *S for playing back segments containing numbers, *N for playing back name segments

need: variable number digit verification

accuracy: can have variable level of false alarm rate

(Utterance Verification)
② Coded Speech

5. PRESENT STATE OF THE ART

Briefly describe the closest already-known technology that relates to the invention. This would include, for example, already existing products, methods or compositions which are known to you personally or through descriptions in publications or patents.

Word spotting: This involves for any fragment of keywords or key phrases in the input speech utterance. This involves matching the characteristics of the keywords & key phrases and filter segments another matching the input speech utterance with these models to find the best keyword & key phrase.

6. ADVANCEMENT IN STATE OF THE ART

Briefly describe the unique advancement achieved by the invention. This may be done, for example, by describing a problem with the prior art that is solved or specific objects that are achieved by the invention.

This invention extends the word spotting and utterance verification technologies to the "caller classification" application for voice messages. This enables us to classify the voice messages according to a registered set of callers. This will enable the user to select and retrieve just the messages from any of the registered set of callers. The system can also be enhanced with the use of speaker verification for increasing the access security.

7. HOW ACHIEVED

Briefly describe the invention and how it achieves the advancement described in paragraph 6.

The user first registers a set of caller names. This can be done either via text or by speech input. When the voice messages are received they are compared to the name models for the callers and are classified as coming from one of the registered callers or not. This can be done as soon as the message is received or at the time of retrieval. When the user is ready to retrieve the messages, the user can retrieve messages of any one of the registered callers by speaking the name or by touch tone input for a speaker number. The user's own name model can be saved by a touch speech input.

5. PRESENT STATE OF THE ART

Briefly describe the closest already-known technology that relates to the invention. This would include, for example, already existing products, methods or compositions which are known to you personally or through descriptions in publications or patents.

Word Spelling

6. ADVANCEMENT IN STATE OF THE ART

Briefly describe the unique advancement achieved by the invention. This may be done, for example, by describing a problem with the prior art that is solved or specific objects that are achieved by the invention

This invention uses key phrase detection and/or utterance verification technologies to look for certain key segments such as names. This is XYZ; My name is XYZ. Telephone numbers, "My number is 123-456-7890" and "You can reach me at 123-456-7890". This will search for & play the desired speech segments only, instead of the whole message.

7. HOW ACHIEVED

Briefly describe the invention and how it achieves the advancement described in paragraph 6.

The user may pre-define some key segments. Then when the message is received or at the time of retrieval, the message is compared to the speech characteristics. The key segments of interest to extract that part from the message. Then just that segment of interest such as "My name is XYZ" or "My phone number is 123-456-7890" is played back to the user. This enables the user to extract just the desired information without having to listen to the complete message.

8. DISCLOSURE OUTSIDE OF LUCENT

Dear Chris:

The above-referenced patent submission is enclosed with this letter. This case is closely related to IDS 115486. Prior to contacting the authors of the submission, please call the Managing Attorney identified above for his thoughts and instructions.

NOTE: This case should be filed by **October 20, 1998**. Please call the Managing Attorney to confirm that this case will be filed on time. If for any reason you cannot meet this date, you **MUST** notify the Managing Attorney and me, VIA FACSIMILE, as soon as possible and no later than 2 weeks prior to our requested date. If possible, the Managing Attorney will then determine if a new but final date can be assigned. Whenever the Managing Attorney and you agree to change the date to file, confirmation via facsimile must be sent to the Managing Attorney and to me for our records.

As soon as you have identified the inventors, please call Joyce Petruzzelli at (732) 949-6068 for a case name and number. After the application is completed, but before the Declaration and Assignment are executed, please send a copy to the Managing Attorney for his review and oral authorization to file. The completed application is to be mailed from your office directly to the USPTO. A copy of all papers which are sent to the USPTO should be sent to Joyce Petruzzelli for our files together with the debit note for preparing the patent application.

Please sign and return a copy of this letter to the Managing Attorney and to me, via facsimile, as confirmation of receipt of the enclosed submission.

Very truly yours,

Eli Weiss

Re: Patent Application for
KEY SEGMENT SPOTTING IN VOICE MESSAGES
Case: Lee 22-1

Dear Padma:

Attached please find a first draft of the above-identified patent application.

Please review the application for accuracy and completeness. The application must provide sufficient information to allow a person of ordinary skill in the field to implement and practice the invention. The application must also disclose the best mode of practicing the invention known to you.

Please provide a copy of the application to Chin-Hui Lee for his review.

As you will note, there are several questions in boldface in the draft application which you need to answer. Please provide your answers and/or comments as soon as possible so that we may file this application by Tuesday, October 20.

If you have any questions, please do not hesitate to call me at 212-891-3956.

Sincerely,

Chris Kolefas

Padma:

Attached is a second draft of the above-referenced patent application incorporating your comments of 10/20 into the first draft of the application (which I fax'ed to you 10/15). As you can see, there are several questions that are still unanswered. Please review this draft. Perhaps this time it would be more efficient if we went over the application on the telephone. Please call me when you are ready to do so.

Thank you,

Chris Kolefas

MESSAGE

Dear Ken:

Attached for your review are final drafts for Lee 22-1 and Lee 23-2. Please provide any comments you may have at your earliest convenience. If everything is in order, please let me so that I can forward Declarations and Assignments to the inventors. Once I receive the executed forms, I will file the applications.

Sincerely,

Chris

EXHIBIT GAtty. Docket No.: Lee 22-1
[561]5334/115485]**ASSIGNMENT AND AGREEMENT**

For value received, we, **Chin-Hui Lee**, of Basking Ridge in the County of Somerset and State of New Jersey and **Padma Ramesh**, of New Providence in the County of Union and State of New Jersey, hereby sell, assign and transfer to **Lucent Technologies Inc.**, a corporation of the State of Delaware, having an office at 600 Mountain Avenue, P.O. Box 636, Murray Hill, New Jersey 07974-0636, U.S.A., and its successors, assigns and legal representatives, the entire right, title and interest, for the United States of America, in and to certain inventions related to **KEY SEGMENT SPOTTING IN VOICE MESSAGES** the specification of which is filed herewith as a United States Patent Application, and all the rights and privileges in said application and under any and all Letters Patent that may be granted in the United States for said inventions; and we also concurrently hereby sell, assign and transfer to **Lucent Technologies Inc.** the entire right, title and interest in and to said inventions for all countries foreign to the United States, including all rights of priority arising from the application aforesaid, and all the rights and privileges under any and all forms of protection, including Letters Patent, that may be granted in said countries foreign to the United States for said inventions.

We authorize **Lucent Technologies Inc.** to make application for such protection in its own name and maintain such protection in any and all countries foreign to the United States, and to invoke and claim for any application for patent or other form of protection for said inventions, without further authorization from us, any and all benefits, including the right of priority provided by any and all treaties, conventions, or agreements.

We hereby consent that a copy of this assignment shall be deemed a full legal and formal equivalent of any document which may be required in any country in proof of the right of **Lucent Technologies Inc.** to apply for patent or other form of protection for said inventions and to claim the aforesaid benefit of the right of priority.

We request that any and all patents for said inventions be issued to **Lucent Technologies Inc.** in the United States and in all countries foreign to the United States, or to such nominees as **Lucent Technologies Inc.** may designate.
